Basic LaTeX Commands and Syntax

The foundation of effective LaTeX usage lies in understanding its basic commands and syntax. LaTeX commands typically begin with a backslash (\) followed by the command name, and many require arguments enclosed in curly braces {}. Mastery of these commands facilitates document creation and customization.

Document Classes and Packages

Every LaTeX document starts with a document class declaration that defines the overall layout and style. Common classes include *article*, *report*, and *book*. Packages extend functionality and are included with the `\usepackage{}` command.

Basic Commands Overview

Key commands include `\title{}` for setting the document title, `\author{}` for author(s), and `\date{}` for specifying the date. The `\begin{document}` and `\end{document}`

commands delimit the main content.

- `\section{}` and `\subsection{}` create document sections.
- `\textbf{}` applies bold formatting.
- `\emph{}` emphasizes text, usually italic.
- `\item` is used within list environments.

Mathematical Typesetting in LaTeX

LaTeX is renowned for its superior math typesetting capabilities, making it the standard for academic and scientific documents. The cheat sheet latex includes commands for inline and display math, symbols, and complex equations.

Inline and Display Math Modes

Inline math is enclosed within dollar signs `$ ... $`, allowing mathematical expressions to appear within text lines. Display math, used for standalone equations, is enclosed within `\[ ... \]` or the `equation` environment.

Common Mathematical Symbols and Operators

LaTeX supports an extensive range of mathematical symbols. Some frequently used commands include:

- `\alpha`, `\beta`, `\gamma` for Greek letters.
- `\sum` for summation symbol.
- `\int` for integral sign.
- `\frac{numerator}{denominator}` for fractions.
- `\sqrt{}` for square roots.

Text Formatting and Special Characters

Effective text formatting is critical in LaTeX documents. The cheat sheet latex provides

guidance on controlling fonts, styles, sizes, and handling special characters that have reserved meanings in LaTeX.

Font Styles and Sizes

LaTeX allows changes to text appearance through commands such as `\textit{}` for italics, `\texttt{}` for monospaced fonts, and size commands like `\small`, `\large`, and `\Huge`. These commands enhance readability and emphasize important text sections.

Escaping Special Characters

Certain characters like `#`, `$`, `%`, `&`, `_`, `{`, `}`, `~`, `^`, and `\` are reserved in LaTeX and must be escaped using a backslash to appear as literal characters in the output. For example, use `\%` to display a percent sign.

Document Structure and Sectioning

Organizing content logically is essential in complex documents. LaTeX provides a hierarchy of sectioning commands to structure documents clearly and consistently.

Sectioning Commands

LaTeX offers commands to create sections, subsections, subsubsections, paragraphs, and subparagraphs. These include:

- `\section{}`
- `\subsection{}`
- `\subsubsection{}`
- `\paragraph{}`
- `\subparagraph{}`

These commands automatically number the sections and generate entries for the table of contents if enabled.

Table of Contents Generation

The command `\tableofcontents` creates a table of contents based on the sectioning

commands used. This feature simplifies navigation in larger documents.

Handling Figures and Tables

Incorporating visual elements is vital for many documents. LaTeX provides environments and commands to insert and manage figures and tables with precise control.

Figures and Images

The figure environment is used to wrap images and include captions. The `\includegraphics{}` command from the `graphicx` package inserts images into the document.

Tables and Tabular Environment

Tables are created using the `table` environment for floating and the `tabular` environment for the actual table content. Alignment, borders, and spacing are customizable with specific commands.

- `l`, `c`, and `r` specify column alignment (left, center, right).
- `\hline` adds horizontal lines.
- `\multicolumn{}` merges columns.

Bibliographies and Citations

Managing references is streamlined in LaTeX through built-in commands and external tools like BibTeX. The cheat sheet latex includes essential commands for citing sources and generating bibliographies.

Citation Commands

The `\cite{}` command inserts citations within the text, corresponding to entries in a bibliography database. Variants like `\citep{}` and `\citet{}` are available through citation packages such as `natbib`.

Bibliography Management

LaTeX supports the inclusion of bibliographies using the `thebibliography` environment or

by referencing external .bib files with BibTeX. This approach automates formatting and numbering of references.
