Understanding the Impact Factor

The impact factor is a widely recognized bibliometric indicator used to assess the relative importance of an academic journal within its field. It measures the average number of citations received by articles published in a specific journal during the preceding two years. This metric is often utilized by researchers, institutions, and funding bodies to gauge the quality and influence of journals when deciding where to publish or allocate resources. While it has limitations, the impact factor remains a key parameter in academic publishing, especially in fast-developing fields such as digital health.

Definition and Calculation

The impact factor is calculated annually by dividing the number of citations in the current year to items published in the previous two years by the total number of substantive articles published during those two years. This approach helps quantify the average citation impact of articles within a journal, serving as an indicator of relevance and scholarly influence.
